

SAVORY Tall Fescue

Soft-leaved with excellent quality forage

Management Profile

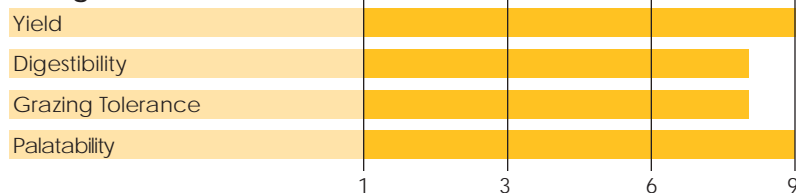

Endophyte Free!

- Good winter hardiness
- Drought tolerant
- Good regrowth
- Excellent palatability

Savory tall fescue is a soft-leaved tall fescue variety with excellent forage quality, high yields and very good persistence. Compared to other forage tall fescues, Savory has demonstrated superior palatability and is endophyte FREE. Savory produces narrow leaves which produce thicker stands that are highly tolerant to grazing. Broad adaptability and resistance to major diseases makes Savory an excellent forage choice.

Savory is well suited to situations where high forage dry matter production and persistence are the main objectives. Savory grows well in a range of soil conditions. It can be used for hay production or grazing in both the northern and southern parts of the United States.
